Postmortem INC-0917: Telemetry Outage

Summary

On 22 August 2026 the fleet telemetry pipeline was unavailable for 47 minutes, from 09:12 to 09:59 CEST. During the outage, robots kept operating but no telemetry reached the customer dashboard.

Root cause

The TLS certificate on the telemetry gateway tg-east-2 expired. The certificate had been issued manually 13 months earlier and was not covered by automatic renewal.

Resolution

The on-call engineer, Tomas Reinholt, issued a new certificate and restarted the gateway. As a permanent fix, all gateway certificates were moved to automatic renewal with cert-manager, and an alert now fires 21 days before any certificate expires.

Customer impact

Fourteen customers were affected. Each affected customer received a service credit of 5 percent of their monthly subscription fee.
